

we can solve it.

# ATS ONLINE MARKETPLACE RELEASE NOTES

VERSION: 2016.14

## RESOLVED ISSUES

### General

- Modified validator for email addresses to account for a wider range of email addresses (i.e. email addresses starting with a number). (CW31972)
- Added a default email stylesheet to the store folder called printorder.css. This file should not be modified but can be copied and moved. The default installations will point to this in the Store\_Settings entry ConfigEmailCSSURL but can be updated to something else. (CW31535)

### Events

- Modified search results (searchresults.aspx) to not display the add to cart button if the event has a limit set at the event level. NOTE: On versions below 20.0.X.X the iMIS Business Objects do not support this and will show an add to cart button even if the limit on the event is full. It is recommended to set limits on the functions, which is supported. (CW31989)
- Modified code that checks what is in the cart to remove a registration if an event has reached the event maximum. Previously, only function levels were checked. NOTE: On versions below 20.0.X.X the iMIS Business Objects do not support this and will not remove the registration from the cart even if the limit on the event is full. It is recommended to set limits on the functions, which is supported. (CW32094)

### Administrative Portal

- Added Store\_Event\_Guest\_Badge\_Fields to list of general lookup/validation tables in administrative portal under verify link. (CW31372)

we can solve it.
